

How far along the severity gradient the IIH arm travelled

Counts within the matched IIH arm. Horizontal scale is logarithmic so the small stages remain visible.

Of 2,138 patients with IIH followed after the washout, 66 had an incident seizure, 41 of those met criteria for recurrent or established epilepsy, and 13 were on antiseizure medication for 180 days or more. All 13 fall inside the 41: nobody was treated indefinitely without also meeting the epilepsy criteria. The medication figure is a FLOOR, not a count. Prescribing data for this arm records inpatient administrations rather than outpatient prescriptions, so chronic community treatment is largely invisible; 19 patients in the whole IIH arm meet the 180-day threshold at all. Read 13 as the number that can be demonstrated, not the number that occurred.
