

Cumulative incidence of seizure or epilepsy after IIH

Aalen–Johansen estimate with death as a competing risk. Shaded bands are 95% confidence intervals.

Matched cohort, engagement-restricted, clinical visits only. Outcome ascertained identically in both arms: a qualifying seizure code after the washout, or antiseizure medication continued 180 days or more. Hazard ratio 2.28 (95% CI 1.62 to 3.22), $p = 2.6 \times 10^{-6}$. Proportional hazards $p = 0.94$.
